Questions

Instructions

For the following questions answer them individually

Question 1

What is the equation of a circle with centre of origin and radius is 6 cm?

- A $x^2 + y^2 - y = 36$
- B $x^2 + y^2 - x - y = 36$
- C $x^2 + y^2 - 36 = 0$
- D $x^2 + y^2 - x = 36$

Answer: C

Explanation:

Given,

Center of the circle = (0,0)

Radius of the circle (r) = 6 cm

∴ Equation of the circle is $x^2 + y^2 = r^2$

$$\Rightarrow x^2 + y^2 = 6^2$$

$$\Rightarrow x^2 + y^2 = 36$$

$$\Rightarrow x^2 + y^2 - 36 = 0$$

Hence, the correct answer is Option C

Question 2

The equation of circle with centre (1, -2) and radius 4 cm is:

- A $x^2 + y^2 + 2x - 4y = 11$
- B $x^2 + y^2 + 2x - 4y = 16$
- C $x^2 + y^2 - 2x + 4y = 16$
- D $x^2 + y^2 - 2x + 4y = 11$

Answer: D

Explanation:

Given,

Centre of the circle (a, b) = (1, -2)

Radius of the circle (r) = 4 cm

∴ Equation of the circle is $(x - a)^2 + (y - b)^2 = r^2$

$$\Rightarrow (x - 1)^2 + (y - (-2))^2 = 4^2$$

$$\Rightarrow (x - 1)^2 + (y + 2)^2 = 4^2$$

$$\Rightarrow x^2 + 1^2 - 2 \cdot x \cdot 1 + y^2 + 2^2 + 2 \cdot y \cdot 2 = 16$$

$$\Rightarrow x^2 + 1 - 2x + y^2 + 4 + 4y = 16$$

$$\Rightarrow x^2 - 2x + y^2 + 4y = 16 - 1 - 4$$

$$\Rightarrow x^2 + y^2 - 2x + 4y = 11$$

Hence, the correct answer is Option D

Question 3

In $\triangle ABC$, $AB = AC$. A circle drawn through B touches AC at D and intersect AB at P. If D is the mid point of AC and AP 2.5 cm, then AB is equal to:

- A 9 cm
- B 10 cm
- C 7.5 cm
- D 12.5 cm

Answer: B

Explanation:

Given D is midpoint of AC so,

$$AD = \frac{AC}{2}$$

But also given $AC = AB$

$$AD = \frac{AB}{2} \text{ ---(1)}$$

AD is a tangent and APB is a secant. So the tangent secant theorem can be applied,

$$AD^2 = AP \times AB$$

$$\left(\frac{AB}{2}\right)^2 = 2.5 \times AB$$

$$\frac{AB^2}{4} = 2.5 \times AB$$

$$AB = 10 \text{ cm}$$

3 Free Mock for RBI Grade-B (With Solutions)

Question 4

The graph of the equations $5x - 2y + 1 = 0$ and $4y - 3x + 5 = 0$, intersect at the point $P(\alpha, \beta)$, What is the value of $(2\alpha - 3\beta)$?

- A 4
- B 6
- C -4
- D -3

Answer: A

Explanation:

$$5x - 2y + 1 = 0$$

$$15x - 6y + 3 = 0 \text{ ---(1)}$$

$$3x - 4y - 5 = 0$$

$$15x - 20y - 25 = 0 \text{ ---(2)}$$

From eq (1) and (2),

$$14y + 28 = 0$$

$$y = -2$$

From eq(1),

$$15x + 6 \times 2 + 3 = 0$$

$$x = -1$$

$$\alpha = -1$$

$$\beta = -2$$

$$(2\alpha - 3\beta)$$

$$= (2 \times (-1) + 3 \times 2) = 4$$

Question 5

What is the area (in square units) of the triangular region enclosed by the graphs of the equations $x + y = 3$, $2x + 5y = 12$ and the x-axis?

A 2

B 3

C 4

D 6

Answer: B

Explanation:

$$x + y = 3$$

$$2x + 2y = 6 \text{ ---(1)}$$

$$2x + 5y = 12 \text{ ---(2)}$$

From eq (1) and eq (2),

$$3y = 6$$

$$y = 2$$

So height = 2

$$y = 0 \text{ ---(3)}$$

put the value of y in eq(1) and (2),

$$2x = 6$$

$$x = 3$$

$$\text{And } 2x = 12$$

$$x = 6$$

$$\text{Area} = \frac{1}{2} \times \text{base} \times \text{height}$$

$$= \frac{1}{2} \times (6 - 3) \times 2 = 3 \text{ square units}$$

Question 6

The graphs of the equations $2x + 3y = 11$ and $x - 2y + 12 = 0$ intersects at $P(x_1, y_1)$ and the graph of the equations $x - 2y + 12 = 0$ intersects the x-axis at $Q(x_2, y_2)$. What is the value of $(x_1 - x_2 + y_1 + y_2)$?

A 13

B -11

C 15

D -9

Answer: C

Explanation:

$$2x + 3y = 11 \text{ ---(1)}$$

$$x - 2y + 12 = 0$$

$$2x - 4y = -24 \text{ ---(2)}$$

From eq (1) and (2),

$$7y = 35$$

$$y = 5 = y_1$$

From eq (1),

$$2x + 3 \times 5 = 11$$

$$2x = -4$$

$$x = -2 = x_1$$

Now,

The graph of the equations $x - 2y + 12 = 0$ intersects the x-axis.

So,

$$y = y_1 = 0$$

$$x - 0 + 12 = 0$$

$$x = -12 = x_1$$

$$(x_1 - x_2 + y_1 + y_2)$$

$$= -2 + 12 + 5 + 0 = 15$$

RBI Grade B Previous Papers PDF

Question 7

The point of intersection of the graphs of the equations $3x - 5y = 19$ and $3y - 7x + 1 = 0$ is $P(\alpha, \beta)$. What is the value of $(3\alpha - \beta)$?

A -2

B -1

C 1

D 0

Answer: B

Explanation:

The point of intersection of the graphs of the equations $3x - 5y = 19$ and $3y - 7x + 1 = 0$ is $P(\alpha, \beta)$

So,

$$3\alpha - 5\beta = 19 \text{ ---(1)}$$

$$7\alpha - 3\beta = 1 \text{ ---(2)}$$

Eq(1) multiply by 3 and eq (2) multiply by 5,

$$9\alpha - 15\beta = 57 \text{ ---(3)}$$

$$35\alpha - 15\beta = 5 \text{ ---(4)}$$

From eq (3) and (4),

$$26\alpha = -52$$

$$\alpha = -2$$

From eq (1),

$$3 \times -2 - 5\beta = 19$$

$$\beta = -5$$

Now,

$$\begin{aligned}
 &(3\alpha - \beta) \\
 &= (3 \times -2 + 5s) \\
 &= -1
 \end{aligned}$$

Question 8

The graph of the equation $x - 7y = -42$, intersects the y-axis at $P(\alpha, \beta)$ and the graph of $6x + y - 15 = 0$, intersects the x-axis at $Q(\gamma, \delta)$, What is the value of $\alpha + \beta + \gamma + \delta$?

- A $\frac{17}{2}$
- B 6
- C $\frac{9}{2}$
- D 5

Answer: A

Explanation:

The graph of the equation $x - 7y = -42$, intersects the y-axis at $P(\alpha, \beta)$

$$\text{So, } x = 0$$

$$0 - 7y = -42$$

$$y = 6$$

$$\alpha = 0$$

$$\beta = 6$$

graph of $6x + y - 15 = 0$, intersects the x-axis at $Q(\gamma, \delta)$

$$\text{So, } y = 0$$

$$6x - 15 = 0$$

$$x = 5/2$$

$$\gamma = 5/2$$

$$\delta = 0$$

Now,

$$\alpha + \beta + \gamma + \delta$$

$$= 0 + 6 + 5/2 + 0 = \frac{17}{2}$$

Question 9

The graphs of the equations $3x + y - 5 = 0$ and $2x - y - 5 = 0$ intersect at the point $P(\alpha, \beta)$. What is the value of $(3\alpha + \beta)$?

- A 4
- B -4
- C 3
- D 5

Answer: D

Explanation:

When graphs of the equations intersect at the point $P(\alpha, \beta)$ then,

$$3\alpha + \beta - 5 = 0 \text{ ---(1)}$$

$$2\alpha - \beta - 5 = 0 \text{ ---(2),}$$

On eq(1) + (2),

$$5\alpha - 10 = 0$$

$$\alpha = 2$$

From the eq(2),

$$3 \times 2 + \beta - 5 = 0$$

$$\beta = -1$$

Now,

$(3\alpha + \beta) = 3 \times 2 - 1 = 6 - 1 = 5$
 \therefore The correct answer is option D.

RBI Grade-B Study Material (Download PDF)

Question 10

The graph of $x + 2y = 3$ and $3x - 2y = 1$ meet the Y-axis at two points having distance

- A $\frac{8}{3}$ units
- B $\frac{4}{3}$ units
- C 1 units
- D 2 units

Answer: D

Explanation:

on Y axis, $x=0$

put $x = 0$ in $x+2y = 3$

$$2y = 3$$

$$y = \frac{3}{2}$$

putting $x=0$ in $3x-2y = 1$

$$-2y = 1$$

$$y = -\frac{1}{2}$$

therefore points on Y-axis are

$$(0, \frac{3}{2}) \text{ and } (0, -\frac{1}{2})$$

$$\text{required distance} = \sqrt{(0-0)^2} + \sqrt{(\frac{3}{2} + \frac{1}{2})^2}$$

$$= \sqrt{(0+4)} = 2 \text{ units}$$

Question 11

ABCD is a cyclic quadrilateral, AB and DC when produced meet at P, if $PA = 8$ cm, $PB = 6$ cm, $PC = 4$ cm, then the length (in cm) of PD is

- A 6
- B 12
- C 8
- D 10

Answer: B

Explanation:

Given that, $PA = 8\text{ cm}$, $PB = 6\text{ cm}$, $PC = 4\text{ cm}$

As per tangent & secant rule,

$$PA \times PB = PD \times PC$$

$$\Rightarrow PD = \frac{8 \times 6}{4} = 12\text{ cm}$$

Question 12

In a circle, chords AD and BC meet at a point E outside the circle. If $\angle BAE = 76^\circ$ and $\angle ADC = 102^\circ$, then $\angle AEC$ is equal to:

- A 25°
- B 28°
- C 26°
- D 24°

Answer: C

Explanation:

In cyclic quadrilateral ABCD, sum of opposite angles = 180°

$$\Rightarrow \angle BAE + \angle BCD = 180^\circ$$

$$\Rightarrow 76^\circ + \angle BCD = 180^\circ$$

$$\Rightarrow \angle BCD = 104^\circ$$

From the figure,

$$\angle ADC + \angle EDC = 180^\circ$$

$$\Rightarrow 102^\circ + \angle EDC = 180^\circ$$

$$\Rightarrow \angle EDC = 78^\circ$$

$$\angle BCD + \angle ECD = 180^\circ$$

$$\Rightarrow 104^\circ + \angle ECD = 180^\circ$$

$$\Rightarrow \angle ECD = 76^\circ$$

In $\triangle CDE$,

$$\angle DEC + \angle ECD + \angle EDC = 180^\circ$$

$$\Rightarrow \angle AEC + 76^\circ + 78^\circ = 180^\circ$$

$$\Rightarrow \angle AEC + 154^\circ = 180^\circ$$

$$\Rightarrow \angle AEC = 26^\circ$$

Hence, the correct answer is Option C

RBI Assistant Free Mock Test (With Solutions)

Question 13

If $\triangle ABC$, $\angle ABC = 90^\circ$ and $BD \perp AC$, if $AD = 4\text{cm}$ and $CD = 5\text{cm}$ then BD is equal to

A $3\sqrt{5}$

B $2\sqrt{5}$

C $3\sqrt{2}$

D $4\sqrt{5}$

Answer: B

Explanation:

Let $\angle C = x$

In $\triangle ABC$,

$$\cos x = \frac{BC}{9}$$

$$\Rightarrow BC = 9 \cos x$$

In $\triangle BCD$,

$$\cos x = \frac{5}{BC}$$

$$\Rightarrow \cos x = \frac{5}{9 \cos x}$$

$$\Rightarrow \cos^2 x = \frac{5}{9}$$

$$\Rightarrow \cos x = \frac{\sqrt{5}}{3}$$

$$\Rightarrow \sin x = \sqrt{1 - \cos^2 x} = \sqrt{1 - \frac{5}{9}} = \sqrt{\frac{4}{9}} = \frac{2}{3}$$

In $\triangle BCD$,

$$\sin x = \frac{BD}{BC}$$

$$\Rightarrow \frac{2}{3} = \frac{BD}{9 \cos x}$$

$$\Rightarrow \frac{2}{3} = \frac{BD}{9 \left(\frac{\sqrt{5}}{3} \right)}$$

$$\Rightarrow \frac{2}{3} = \frac{3BD}{9(\sqrt{5})}$$

$$\Rightarrow BD = 2\sqrt{5}$$

Hence, the correct answer is Option B

Question 14

In $\triangle ABC$, $\angle A = 72^\circ$. Its sides AB and AC are produced to the points D and E respectively. If the bisectors of the $\angle CBD$ and $\angle BCE$ meet at point O, then $\angle BOC$ is equal to:

A 16°

B 54°

C 32°

D 106°

Answer: B

Explanation:

Given,

In $\triangle ABC$, $\angle A = 72^\circ$

OB is the angular bisector of $\angle CBD$

$$\Rightarrow \angle OBD = \angle OBC$$

$$\text{Let } \angle OBD = \angle OBC = x$$

OC is the angular bisector of $\angle BCE$

$$\Rightarrow \angle OCE = \angle OCB$$

$$\text{Let } \angle OCE = \angle OCB = y$$

From the figure,

$$\angle ABC + \angle CBD = 180^\circ$$

$$\Rightarrow \angle ABC + x + x = 180^\circ$$

$$\Rightarrow \angle ABC = 180^\circ - 2x$$

$$\angle ACB + \angle BCE = 180^\circ$$

$$\Rightarrow \angle ACB + y + y = 180^\circ$$

$$\Rightarrow \angle ACB = 180^\circ - 2y$$

In $\triangle ABC$,

$$\angle ABC + \angle ACB + \angle BAC = 180^\circ$$

$$\Rightarrow 180^\circ - 2x + 180^\circ - 2y + 72^\circ = 180^\circ$$

$$\Rightarrow 2x + 2y = 180^\circ + 72^\circ$$

$$\Rightarrow 2(x + y) = 252^\circ$$

$$\Rightarrow x + y = 126^\circ \dots\dots\dots(1)$$

In $\triangle OBC$,

$$\angle OBC + \angle OCB + \angle BOC = 180^\circ$$

$$\Rightarrow x + y + \angle BOC = 180^\circ$$

$$\Rightarrow 126^\circ + \angle BOC = 180^\circ$$

$$\Rightarrow \angle BOC = 180^\circ - 126^\circ$$

$$\Rightarrow \angle BOC = 54^\circ$$

Hence, the correct answer is Option B

Question 15

The distance between the centres of two circles of radius 2.5 cm each is 13 cm. The length (in cm) of a transverse common tangent is:

A 12

B 8

C 6

D 10

Answer: A

Explanation:

Radius of first circle (r_1) = 2.5 cm

Radius of second circle (r_2) = 2.5 cm

The distance between centres of two circles (d) = 13 cm

$$\therefore \text{Length of the common tangent} = \sqrt{d^2 - (r_1 + r_2)^2}$$

$$= \sqrt{13^2 - (2.5 + 2.5)^2}$$

$$= \sqrt{169 - 25}$$

$$= \sqrt{144}$$

$$= 12 \text{ cm}$$

Hence, the correct answer is Option A

Question 16

ABCD is a cyclic quadrilateral such that AB is a diameter of the circle circumscribing it and $\angle ADC = 126^\circ$. $\angle BAC$ is equal to:

- A 24°
- B 72°
- C 18°
- D 36°

Answer: D

Explanation:

In cyclic quadrilateral ABCD, sum of opposite angles = 180°

$$\Rightarrow \angle ADC + \angle ABC = 180^\circ$$

$$\Rightarrow 126^\circ + \angle ABC = 180^\circ$$

$$\Rightarrow \angle ABC = 54^\circ$$

Angle subtended by diameter in a semicircle is 90°

$$\Rightarrow \angle ACB = 90^\circ$$

In $\triangle ACB$,

$$\angle BAC + \angle ACB + \angle ABC = 180^\circ$$

$$\Rightarrow \angle BAC + 90^\circ + 54^\circ = 180^\circ$$

$$\Rightarrow \angle BAC + 144^\circ = 180^\circ$$

$$\Rightarrow \angle BAC = 36^\circ$$

Hence, the correct answer is Option D

Question 17

In $\triangle ABC$, $\angle A = 52^\circ$. Its sides AB and AC are produced to the points D and E respectively. If the bisectors of the $\angle CBD$ and $\angle BCE$ meet at point O, then $\angle BOC$ is equal to:

- A 64°
- B 16°

C 106°

D 32°

Answer: A

Explanation:

Given,

In $\triangle ABC$, $\angle A = 52^\circ$

OB is the angular bisector of $\angle CBD$

$\Rightarrow \angle OBD = \angle OBC$

Let $\angle OBD = \angle OBC = x$

OC is the angular bisector of $\angle BCE$

$\Rightarrow \angle OCE = \angle OCB$

Let $\angle OCE = \angle OCB = y$

From the figure,

$\angle ABC + \angle CBD = 180^\circ$

$\Rightarrow \angle ABC + x + x = 180^\circ$

$\Rightarrow \angle ABC = 180^\circ - 2x$

$\angle ACB + \angle BCE = 180^\circ$

$\Rightarrow \angle ACB + y + y = 180^\circ$

$\Rightarrow \angle ACB = 180^\circ - 2y$

In $\triangle ABC$,

$\angle ABC + \angle ACB + \angle BAC = 180^\circ$

$\Rightarrow 180^\circ - 2x + 180^\circ - 2y + 52^\circ = 180^\circ$

$\Rightarrow 2x + 2y = 180^\circ + 52^\circ$

$\Rightarrow 2(x + y) = 232^\circ$

$\Rightarrow x + y = 116^\circ \dots\dots\dots(1)$

In $\triangle OBC$,

$\angle OBC + \angle OCB + \angle BOC = 180^\circ$

$\Rightarrow x + y + \angle BOC = 180^\circ$

$\Rightarrow 116^\circ + \angle BOC = 180^\circ$

$$\Rightarrow \angle BOC = 180^\circ - 116^\circ$$

$$\Rightarrow \angle BOC = 64^\circ$$

Hence, the correct answer is Option A

Question 18

PA and PB are the tangents to a circle with centre O, from a point P outside the circle. A and B are the points on the circle. If $\angle APB = 72^\circ$, then $\angle OAB$ is equal to:

A 24°

B 18°

C 36°

D 72°

Answer: C

Explanation:

Given, $\angle APB = 72^\circ$

PA and PB are the tangents to the circle with centre O

$$\Rightarrow \angle OAP = 90^\circ \text{ and } \angle OBP = 90^\circ$$

In quadrilateral OAPB,

$$\angle AOB + \angle OBP + \angle APB + \angle OAP = 360^\circ$$

$$\Rightarrow \angle AOB + 90^\circ + 72^\circ + 90^\circ = 360^\circ$$

$$\Rightarrow \angle AOB + 252^\circ = 360^\circ$$

$$\Rightarrow \angle AOB = 108^\circ$$

In $\triangle OAB$, $OA = OB$

Angles opposite to equal sides are equal in triangle

$$\Rightarrow \angle OBA = \angle OAB$$

In $\triangle OAB$,

$$\angle AOB + \angle OBA + \angle OAB = 180^\circ$$

$$\Rightarrow 108^\circ + \angle OAB + \angle OAB = 180^\circ$$

$$\Rightarrow 2\angle OAB = 72^\circ$$

$$\Rightarrow \angle OAB = 36^\circ$$

Hence, the correct answer is Option C

Best Youtube Channel for Banking Preparation

Question 19

The distance between the centres of two circles of radius 3 cm and 2 cm is 13 cm. The length (in cm) of a transverse common tangent is:

- A 8
- B 12
- C 6
- D 10

Answer: B

Explanation:

Radius of first circle (r_1) = 3 cm

Radius of second circle (r_2) = 2 cm

The distance between centres of two circles (d) = 13 cm

$$\therefore \text{Length of the common tangent} = \sqrt{d^2 - (r_1 + r_2)^2}$$

$$= \sqrt{13^2 - (3 + 2)^2}$$

$$= \sqrt{169 - 25}$$

$$= \sqrt{144}$$

$$= 12 \text{ cm}$$

Hence, the correct answer is Option B

Question 20

The distance between the centre of two circles of radius 4 cm and 2 cm is 10 cm. The length (in cm) of a transverse common tangent is:

- A 4
- B 6
- C 10
- D 8

Answer: D

Explanation:

Given, distance between centres of circles (d) = 10 cm

Radius of first circle (r_1) = 4 cm

Radius of second circle (r_2) = 2 cm

$$\therefore \text{The length of transverse common tangent} = \sqrt{d^2 - (r_1 + r_2)^2} = \sqrt{10^2 - (4 + 2)^2} = \sqrt{100 - 36} = 8 \text{ cm}$$
